ACKNOWLEDGEMENT

At every outset I express my gratitude to almighty lord for showering his grace and blessings upon me to complete this project.

Although my name appears on the cover of the record, many people had contributed in some form for development of this project. I might have not been success to complete this project without assistance or support of each of the following well-wishers.

My deepest thanks of **Mrs. Priyanka Rout (H.O.D)**, the guide of the project for guiding and correcting various documents with attention and care. He has taken many pains to go through the project and make necessary correction as and when needed.

Finally, I would like to thank my friends for their co-operation and team work to complete this project.

Successfully.

ABSTRACT

Skyly is a **premium web-based weather application** designed to provide accurate, real-time weather information along with a visually appealing and user-friendly interface. The application aims to bridge the gap between raw meteorological data and user-friendly presentation. Many existing weather applications focus heavily on data but often compromise on user experience by cluttering the interface with advertisements, unnecessary information, or confusing layouts. Skyly addresses these shortcomings by delivering a clean, minimal, and modern weather experience.

The Skyly application is built using **HTML, CSS, and JavaScript**, which are core frontend web technologies. These technologies ensure that the application runs efficiently on modern browsers without the need for additional plugins or installations. Weather data is fetched using the **Open-Meteo API**, a reliable and open-source weather data provider. This allows Skyly to provide accurate current weather conditions and a detailed 7-day forecast for cities across the globe.
